platform: macOS / Chromium

capture_status: verified-synthetic

Diagnose an interrupted transfer

Inspect an interrupted synthetic preparation and verify recovery before downloading.

Deployment: Synthetic Studio. macOS / Chromium.

Synthetic test fixture. These screenshots demonstrate the pipeline, not an installed Media Nexus client.

Deployment configuration

collections: True

remoteTransfer: True

workstation: Synthetic review workstation

Prerequisites

Sign in as the synthetic docs-reviewer.

Remote download must be enabled.

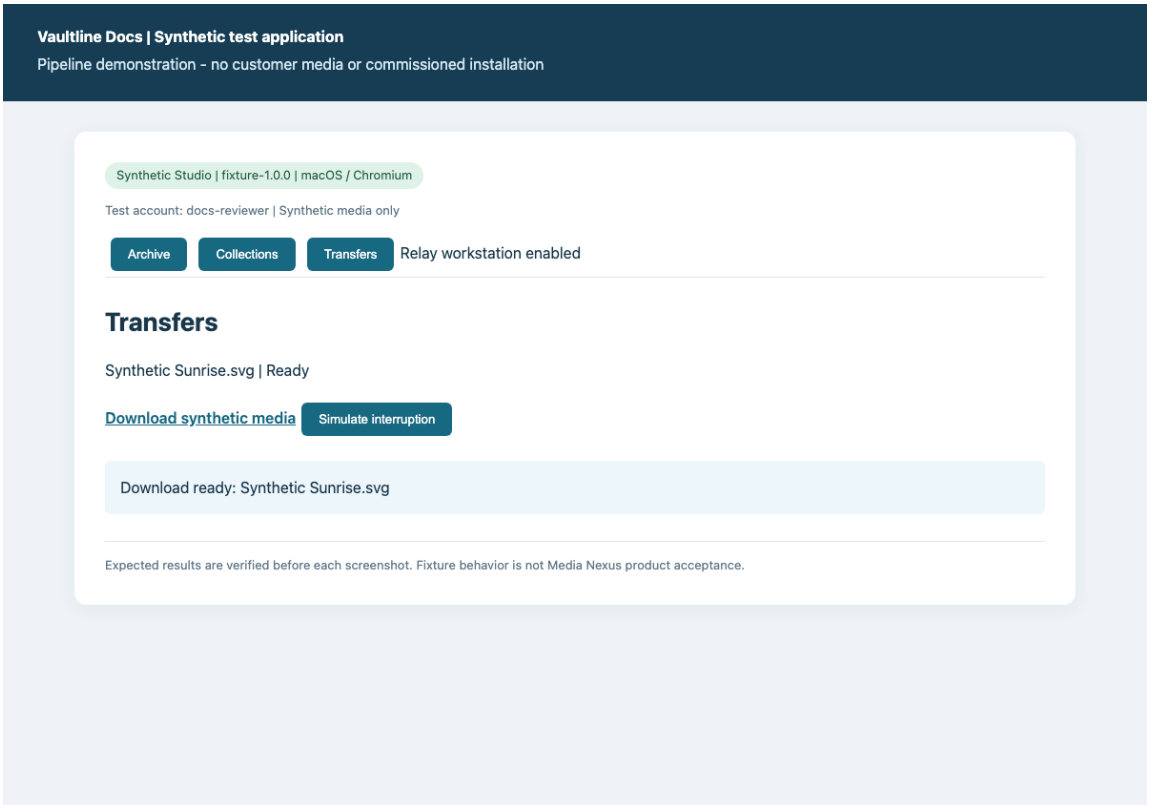

Use only the fixture interruption control; do not interrupt a live customer transfer.

Steps

1. Prepare a test transfer

Search sunrise, select the asset and prepare a download.

Expected: Download ready: Synthetic Sunrise.svg

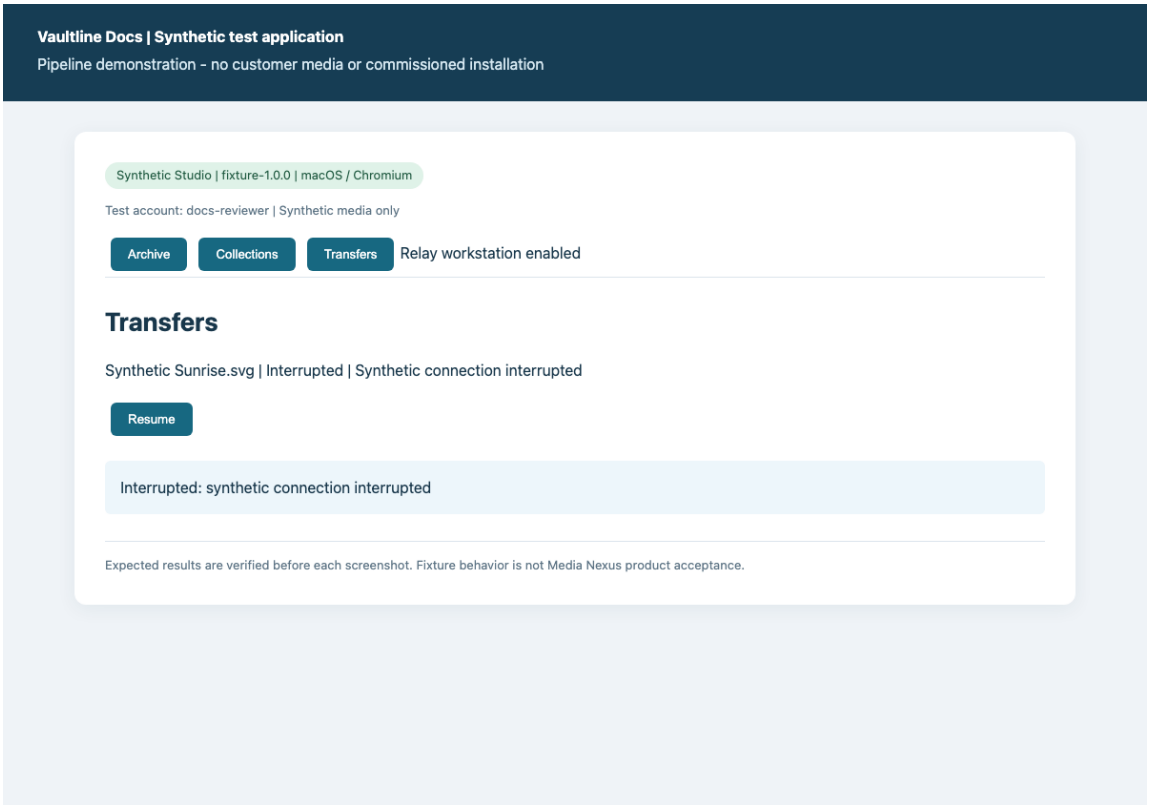

Download ready: Synthetic Sunrise.svg

2. Inspect interruption

Choose Simulate interruption and inspect the transfer status and error.

Expected: Interrupted: synthetic connection interrupted

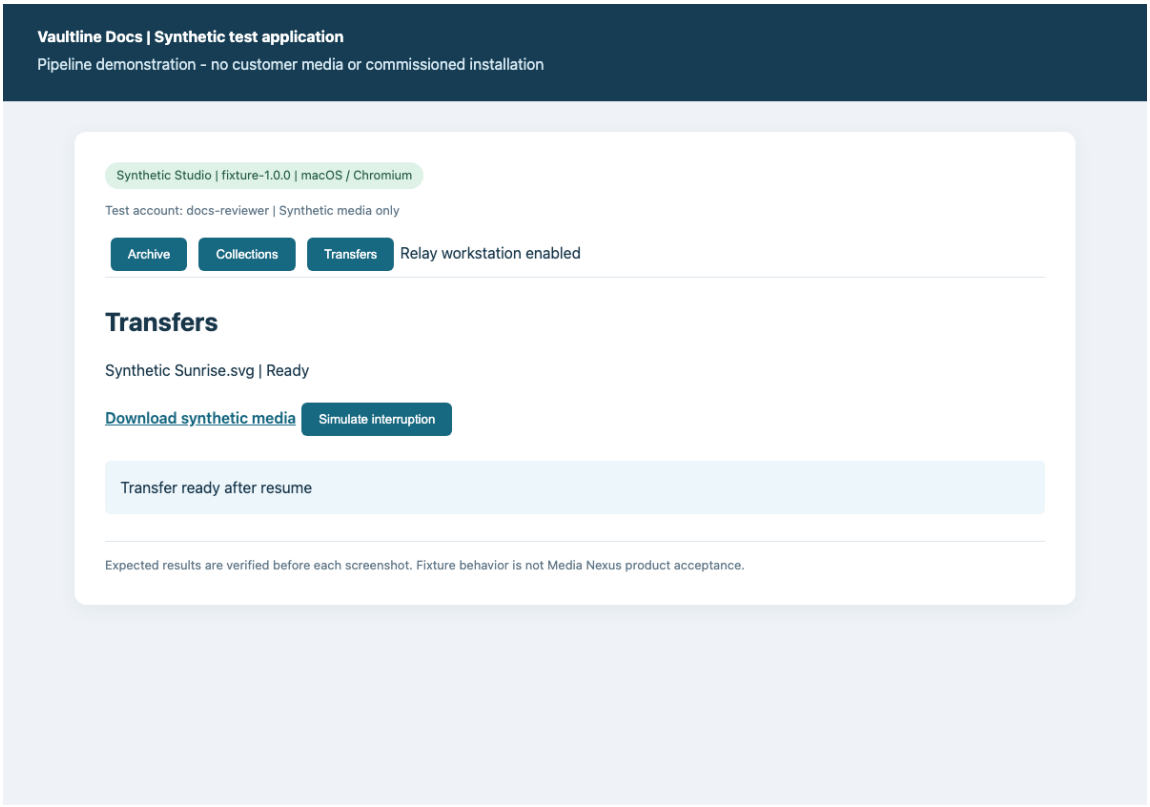

Interrupted: synthetic connection interrupted

3. Resume the fixture transfer

Restore the synthetic test connection by choosing Resume. Inspect the row before downloading.

Expected: Transfer ready after resume

Transfer ready after resume

Expected result

The transfer returns to Ready. This fixture does not prove native workstation copy or resumable browser-save behavior in Media Nexus.

Recovery

If the transfer remains Interrupted, inspect the reported error and request review. Do not claim success until Ready is visible.

Evidence and review

Screenshot verification: all documented fixture steps asserted in a fresh browser session.
