platform: macOS / Chrome or Edge

capture_status: not-captured

Search the archive and create a collection

Find indexed media and group selected assets without moving source files.

Deployment: Source review - nexus-archive-only. macOS / Chrome or Edge.

Deployment configuration

canEdit: True

collections: True

remoteTransfer: False

Prerequisites

Archive and Collections must be enabled.

Sign in with permission to manage collections. Guest access does not grant collection editing.

The archive must contain indexed media.

Steps

1. Search media

Open Archive, enter a known indexed filename or term in Search media and submit the search.

Expected: Search results contain indexed media matching the submitted query; verify the asset names before selecting.

2. Select and create

Select the desired media using the asset selection control. Choose Add to collection, enter a Collection name under OR CREATE NEW, optionally enter purpose or handoff context, then choose Create and add.

Expected: The new collection is created with the selected assets.

3. Verify membership

Open Collections, open the newly named collection, and check that it contains the selected assets.

Expected: Collection members are visible; grouping does not move the source files.

Expected result

The selected media appears in the named collection without moving originals.

Recovery

If the archive catalog cannot load, use Retry catalog when offered, then repeat the search.

If Create and add is disabled, check that Collection name is nonempty. Confirm collection-edit permission with the administrator.

Deployment notes

Synthetic deployment instruction: use the prefix ARCHIVE- for handoff collections. Confirm this naming rule before publication.

Evidence and review

Screenshot verification: not captured; running product behavior requires review.
